

## THE AIRNERGY STREAM

The Highlight for your best Friend

## **„ALLOW THE SKIN TO BREATHE...!“**

Animals, like humans, absorb vital energy through their skin on a constant and proportional basis. The so-called tissue matrix, internal respiration as well as cellular respiration, metabolism and repair processes for the entire organism participate.

Contrary to conventional treatment methods, which do not reach the tissue between the cells, the transcellular aspect of Airnergy enables energy to be transported to the centers of the vegetative nervous system, especially the often plagued pineal gland. This not only influences painful relapses, but can also benefit the associated systems, such as the limbic system, the senses, but above all the entire musculoskeletal system and the respiratory organs, but is most frequently used for “signs of wear and tear” and for holistic quality of life.

### **“Skin & bones, tendons & ligaments – pain & illness!”** **Chronic, preventative or acute.**

Experiencing this is restrictive, often sad and usually costly and time-consuming.

Good to know: The intensity and duration of an irritation or illness, whether functional or organic, do not depend solely on the treatment of, for example, a tear in the tendon or 5 cm of bone. The healing process is much more dependent on the metabolism that maintains it – i.e. on the energy. Like the tree of the earth in which it thrives and lives.

Whether the dog has hip dysplasia (HD), tumors in general, or the rabbit has an ear infection; the beloved pony or horse is lame, has cuts, an already corrected leg fracture or even laminitis, the frequently recurring ear infection of a cat is still not healed, toothache or gingivitis, skin irritations or injuries up to dermatitis necroticans in some reptile species; There is now a suitable helper designed for all cases, in a compact and robust housing, similar to a computer mouse and equipped with a process that is familiar to the organism and has been developed and functions according to the model of nature. The active ingredients used: light, air and water – which are sufficiently available in the atmosphere – are simply revitalized.

The newly formed energy with the Airnergy Stream can unfold its effect directly on site, subcutaneously, i.e. directly under the skin or under the coat/scales as well as in the matrix and in a natural way, down to the lower layers of the skin. Exogenous substances, non-physiological, increased oxygen, ionization or ozone are neither supplied nor previously formed.

The molecules previously irradiated with the Airnergy Stream or Airnergy Stream HS are enabled to better release the atmospheric oxygen (21%) into the nearby tissues and surrounding vessels. It is not the quantity of oxygen supplied that is decisive, but the quality, i.e. the availability (utilization) of oxygen, which increases and therefore the oxygen supply and usability in the mitochondria, the power plants of the cells. Biophotons (light quanta) are used to improve cell respiration. Optimal cellular respiration is the prerequisite for providing the equally indispensable energy supplier of the metabolism: ATP (adenosine triphosphate).

## From quantity of oxygen to quality – dermovitalization

Regeneration of the skin and supportive healing (of this organ, which is also the largest for humans), without chemicals or harmful radiation, without side effects, complementary medicine or solely through the active medium: light, air and water – or rather through the atmosphere, in particular through revitalized and (re)activated oxygen in the air we breathe, based on the model of photosynthesis, using Airnergy technology.

The new Airnergy Vet-Stream: Immediate help and permanent cure for animals with skin, fur or dandruff!

## Possible areas of application of the Airnergy Vet-Stream

Musculoskeletal system  
Joints  
Tendons  
Ligaments  
Muscles  
Skin  
Wounds & scars

Burns  
Bones  
Hip dysplasia  
Tumors  
Skin allergies  
Ear inflammation  
Gingivitis

**... for chronic and acute complaints, increasing age, intensive stress, as a precaution, without side effects, complementary or alone.**

## Testimonials from pet owners with the Airnergy Stream and Stream HS

Our little Traudel arrived full of scars and bald patches and my friend who actually owns the streamer said she would try it. She used it successfully on a cut on her galga, she was at the vet for weeks and the wound did not heal, with the streamer within 3 weeks.

Our Traudel's hair has started to grow again and she looks much better. The streamer is currently being used by friends who also have a Galgo from animal welfare, he has a bad scar and currently still has a bite wound which is also being treated.

We bought the Atmos Plus ourselves and are very impressed. I think the streamer is really good for dogs, even with joint diseases etc.

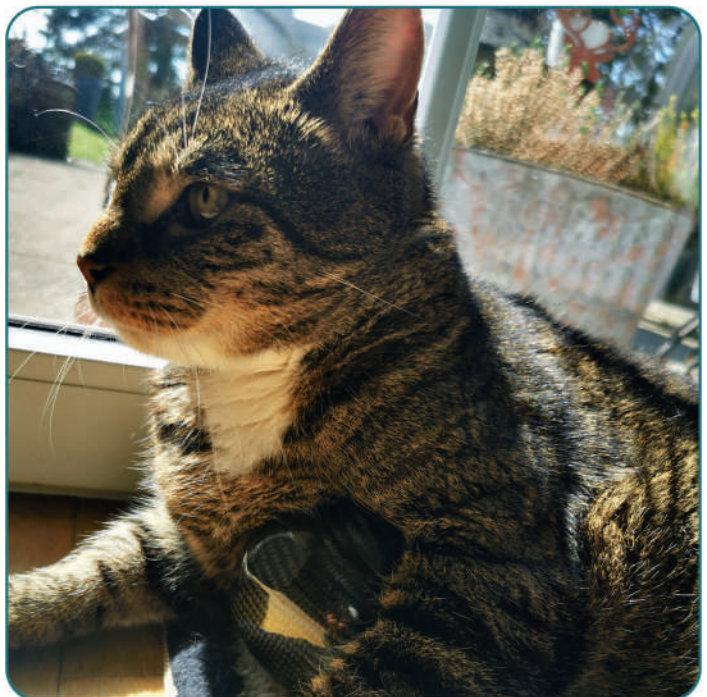

*S.H.*

Leo the dog has survived his 3rd operation and is healing well.

He is tolerating the treatment on all possible parts of his body. However, he doesn't want it on the surgical site yet. That's why I choose the thigh, which is also under a lot of strain due to the shortening of the leg.

Peppy the cat has hardened lung tissue and has difficulty breathing and coughing. The treatment has just started.

*P.K.*

Here is a photo of my senior pug Sarafina (Safi).

She is 12.5 years old and has her spots. I finally got my streamer at the end of last week.

We started the treatment straight away and as you can see, she relaxes when she streams.

Due to a massive blockage in her lumbar spine - you could already see the lack of energy supply visually as the hair in this area had not grown back - the dog was ataxic. I always had to carry her up and down the stairs, she slipped sideways...

After just one day with 3 applications she was walking much better, today after another 3 days she can go up and down the stairs without any problems and enjoys walking through her garden again.

She also has an age-related tracheal stenosis, making her heavy-breathed. An inflammatory swelling in her throat made it even more difficult for her to breathe, so I had to take her to the vet clinic last weekend as an emergency, where she was put in an oxygen box. The next day I was allowed to pick her up again relatively fit, which didn't last very long.

That's why I put so much pressure on you with the device ... and now, a week later, a few days of treatment with the streamer, the dog is deeply relaxed, can snort well again, I hardly notice the inflammation in her throat any more, and I also stopped the steroid (cortisone) immediately when I started the streamer therapy last week.

As it is much warmer, she is currently only given a cooled gel mat from the pet supplies and is not even panting for air. she now has quality of life again, just a week ago I was worried whether she would survive the summer.

I also use the device on the bruise on my foot, which was barely visible after 3 days after my frightened horse jumped on it with 600 kg. Soon healed with heparin ointment, ice pack and streamer.

The streamer is great :-) I will continue to experiment.

W.

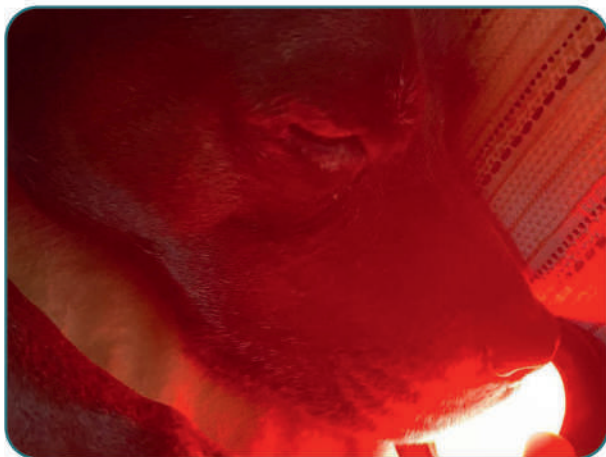

## Testimonials from pet owners with the Airnergy Stream and Stream HS

In her energetic practice, alternative practitioner Sara Bennett experiences small miracles every day. One of these miracles is little Leeland, a Staffordshire terrier with an initially moderate problem.

It is simply incredible what the body is able to achieve when it receives the right cell nutrition. And the term "nourishment" does not only include the nutrients from the solid components we consume every day, but also the flood of frequencies in all their richness and abundance, which ideally make the cells dance, provided the right ones are used effectively.

In this video, Sara and Leeland's owner Kirsten Oriel talk about how the Airnergy Stream was able to help the Staffordshire terrier with an open lump under his nose.

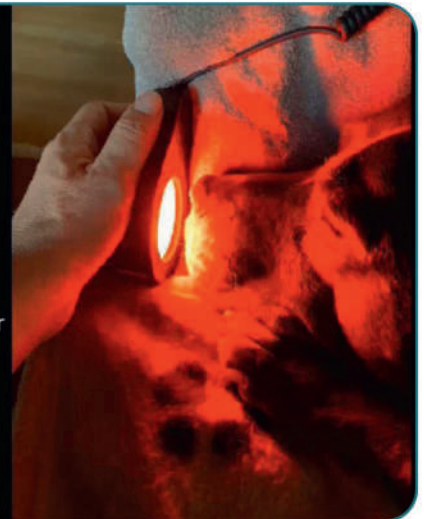

A beautiful story about what frequencies in all their diversity can achieve if they are used.

Von nun an Start

Behandlung mit  
dem Airnergy  
Stream.

Leeland genießt es  
sichtlich.

Guido Bierther, der  
Chef von Airnergy,  
selber ein herzenguter  
Hundepapa, hörte von  
Leeland's Geschichte  
und sagte: "Mensch,  
probiert das mal  
aus! Das ist was  
ganz Besonderes!"

Watch the report by naturopath Sara Bennett and Leeland's owner Kirsten Oriel about the Airnergy Stream on youtube here:

Channon underwent tenoscopy of the subcutaneous bursa of the right hind limb on 19.03.2024.

After the first dressing change in the stable, the joint looked like this (see picture 1).

To support the healing process, Channon was irradiated with Airnergy twice a day for 30 minutes each time for one month from April 13th. From the second month onwards, he was irradiated once a day for 15 minutes.

After some time there was a clear improvement. The wound healed well and quickly. The ankle joint is clearly swollen (see picture 2).

During treatment with the Airnergy Stream:

## Somatovital therapy of sick pets

### Naturopathic complement to conventional treatment

J.M., a doctor of naturopathy in the United States, broadly administers Dermovital therapy (DVT) on his patients in his practice. As a passionate horse breeder, he recounts his own personal highlight with DVT: *"...joint injuries in horses heal faster... A cut close to the eye of a foal healed ,unbelievably' quickly..."*.

Th.E.-R., owner of valuable racehorses, reports: *"...Jawi had an approximately 4 cm long and fairly deep, purulent cut on the ball of one hoof – a location that heals poorly due to continued movement.... Treatment with an ointment didn't help... After a few days, I started to use the Stream twice a day for 10 minutes each prior to treatment with an ointment and anti-inflammatory drops, both of which I also pre-treated with the Stream... After 3 days, the inflammation had disappeared, the wound had closed, formed a crust and was nearly completely healed..."*.

And why not? Why shouldn't a therapy that has proven so successful by sick humans also be used on ailing animals?

In the same way as other Somavital therapies (Spirovital therapy SVT, Gastrovital therapy GVT) DVT (Stream applied directly to the skin or through clothing) also uses activated, excited, unstable Oxygen (in its singlet state  $1O_2$ ) which degrades to its ground state and emits photon energy.

Primarily this works on the immediate locality (skin, vascular system) and influences endothelial tissue, localised leukocytes and macrophages. Secondly, it spreads transcellularly into the adjacent vicinity and influences the passive and active musculoskeletal system. Thirdly, according to recent research, this energy can be stored in hydrogen bonds and transported via the venal system to the epiphyses where it influences the vegetative nervous system.

Questionnaire campaigns amongst patients and statements from therapists generally showed a high level of acceptance of DVT. In most cases improvements could be recorded within a short period of time (after only a few applications), **especially by chronic conditions**, in particular their **acute, inflammatory, painful spasms**, even though, in many cases, a multitude of conventional therapies had had little effect - neither objectively nor subjectively. In most cases, success was shared equally between **functional and organic complaints**, organ related to the **musculoskeletal system, the immune system, the pulmonary organs and teeth, diagnostically related to arthritis, joints, inflammation, injuries, bronchitis, sinus infection, tinnitus and toothache, post-operative and periodontosis related**.

The DVT effect appears capable of influencing localised **skin and mucous membranes** as well as **adjacent structures (muscles, joints, sinuses, vascular endothelium) and (via the vascular system) as far as the vegetative centres (epiphyses)**, on the one hand by way of an increased release of oxygen from the erythrocytes, on the other by way of improved utilisation in the power houses of our cells (the mitochondria), in particular by way of regulating the oxygen excitation responsible for cellular metabolism or by the deactivation of oxygen radicals (ROS) and via the supply of reduction equivalents to stabilise the redox potential.

Collectively, 17 observations/reports have been compiled respective somatovital therapy applications on animals: 3 on dogs, 2 on cats, the remainder on horses. The reports are from 4 therapists, 1 medical consultant and 10 owners without any medical background. In 8 cases the DVT was applied on its own, once in combination with conventional treatment, 3 times GVT on its own, 3 times a combination of GVT and SVT (without any noticeable increased in effect), once SVT on its own and once SVT combined with GVT and DVT. Unanimously, good results are reported with the occasional exuberant vocalisation.

In some cases it was explicitly noted that the SVT was only taken into consideration after conventional treatments had failed. In some cases it was used exclusively from the outset after the owners had experienced good results with treatments on themselves.

Based upon her lengthy experience with Somatovital therapy, a therapist lists symptoms amongst animals that are typical for successful treatment: acute injuries (sprains, contusions, cuts, fractures), in particular related pains; faster and improved healing of wounds after injury and operations; circulation problems; neuralgia; haematoma; respiratory illnesses; dermatological problems.

Finally, a case, as reported in a veterinary medical assessment, impressively explains the effects Somatovital therapy can have on a sick horse: *"The independent inspector was provided documentation by the institute for clinical radiology at the veterinary faculty of the University of Uppsala. May 24th, 1995: serious aspiration pneumonia of both lungs; August 4th, 1995: decisive improvement of the pneumonic changes in both lungs and only minimal densification in the central region. Report from the medical horse clinic regarding the in-patient treatment between May 24th and June 19th: Drastically impaired overall health condition at the time of admission; aspiration pneumonia; infection with streptococcus zooepidemicus; treatment with antibiotics, pain relievers and anti-inflammatory medication through to June 19th led to marked improvement, but not to a complete recovery.*

*After commencement of the SVT (and additional GVT) (June 19th) and contrary to the clinical prognosis (4 to 5 months convalescence), the horse was able to be gradually trained after only 4 weeks. After a further four weeks it was performing at its best again. Comment of the medical expert: According to my own experience in a veterinary medical practice, I can confirm, that usually with such an extreme illness a convalescence of up to 1/2 a year is normal, ...and that racing in the same year cannot be expected. These results are consistent with my own experience in human medicine, where a quick healing of wounds and shortened convalescence after operations in connection with the application of energised oxygen has been observed repeatedly."*

Even if further scientifically monitored results regarding the application of Somatovital therapy in veterinary treatment would be beneficial, the experiences of animal owners, therapists and independent experts are telling a compelling and consistent story. The application has no side-effects, but can in many cases lead to **faster healing, pain relief, motivation, improved circulation and an enhanced immune system - prerequisite for health and well-being.**
